

Warehouse Wizard × NetSuite — Inventory & Operations Brief

Sep 24, 2026 · @Russell Hunte

Wilson, this brief sets out how receiving, storage, picking and returns will work once Warehouse Wizard posts directly into NetSuite, and lists the twelve configuration questions only you can answer. Two of them — whether Advanced Shipping and Advanced Receiving are switched on — decide whether outbound and returns work can be designed at all.

Receiving on the floor

Warehouse Wizard will offer three receiving paths, matching the separate tabs you showed from NetSuite's warehouse dashboard.

Path	Used for	Starts from	What NetSuite creates
Purchase order	Local purchases that go straight from PO to receipt	PO number	One item receipt against the PO
Inbound shipment	Imported containers, one or more POs per shipment	Inbound shipment number	One item receipt per PO on the shipment
Transfer order	Stock sent from another Simplex warehouse	Transfer order number	One item receipt against the transfer order's fulfilment

The inbound shipment flow

1. The receiving report is printed from NetSuite before the container is unstuffed, as today. Jan is adding the PO number to it so each line can be traced to its order.
2. The operator scans or types the shipment number into Warehouse Wizard. The shipment's lines load live from NetSuite, grouped by purchase order.
3. The operator checks the lines against the printed report.
4. As the container is unstuffed, the operator records the quantity actually received per product and prints pallet labels in small batches per product, not in advance.
5. Lot numbers and expiry dates are captured for products that need them.
6. Pallets are put away to bins.

7. Warehouse Wizard posts the receipt. NetSuite creates one item receipt per PO and updates the shipment and PO statuses.

8. Payables confirms rates and landed cost in NetSuite afterwards.

One technical point you should know. NetSuite's standard integration can read an inbound shipment but has no standard way to receive one; that action is only available to scripts running inside NetSuite. Jan will write a small NetSuite-side service for it (about 2–4 days). As you said in the meeting, once a PO is attached to an inbound shipment it can only be received through the shipment, so receiving the POs directly is not a workaround.

Only shipments marked In Transit or Partially Received will be offered for receiving, matching NetSuite's own rule.

Receiving rules

Short deliveries

When 95 arrive against a PO for 100, Simplex must pick one policy. The recommendation is **receive and flag**.

Policy	What happens	Best when
Receive what arrived	95 received; 5 stays open on the PO	The balance may still arrive on a different shipment with the same PO
Receive and flag	95 received; an exception is raised for the buyer to chase or close	Differences need follow-up with the supplier
Receive and adjust	95 received; the line is closed and the difference written off	Short deliveries are final

Receiving more than ordered

NetSuite blocks a receipt above the PO quantity unless **Allow Overage on Item Receipts** is switched on (Accounting Preferences, Order Management). Warehouse Wizard will follow whatever that setting is.

Transfer orders must match exactly

NetSuite requires a transfer order receipt to match its fulfilment exactly: the same quantity, the same lot and serial numbers, and dated no earlier than the shipment. If 50 were sent and 48 arrive, the recommendation is to **receive 50, then post a stock**

adjustment for the 2. That keeps NetSuite consistent and leaves a clear audit trail. Warehouse Wizard will pre-fill the transfer receipt from the fulfilment, including the lots that were shipped.

Lots and expiry

Lot numbers and expiry dates are captured at receipt for lot-tracked items and sent to NetSuite on the receipt line. For items that are not lot-tracked in NetSuite, expiry stays in Warehouse Wizard only.

Storage

How the two systems map

NetSuite	Warehouse Wizard	Notes
Location	Warehouse	Pine, Lower Estate and the new warehouse. Already mapped in Settings → NetSuite Location Mapping
Bin	Location (bay, level, position)	Bins must be created in NetSuite to mirror Warehouse Wizard, as you said. Needed only where the NetSuite location has Use Bins switched on
(no equivalent)	Zone	Warehouse Wizard's grouping for putaway, picking, staging and quarantine
(no equivalent)	Pallet	Warehouse Wizard only; see below
Lot number	Lot	Only for items that are lot-tracked in NetSuite
Inventory status	Stock status (available, held, damaged)	Only if the Inventory Status feature is on

Oracle warns against creating NetSuite locations for areas inside a warehouse, such as a dock or picking zone, because it breaks costing and reporting. Those stay as bins or Warehouse Wizard zones.

Pine and Lower Estate

Neither is in Warehouse Wizard yet. Before Phase 1 testing, Simplex needs to define each warehouse's zones and bins in Warehouse Wizard and create the matching bins in NetSuite. This is data entry rather than development, but it is the task most likely to hold up testing, so it should start now.

Pallets

NetSuite has no pallet record. Three options were discussed; the recommendation is **Option A**.

Option	Assessment
A. Pallets live in Warehouse Wizard only	Recommended. NetSuite receives quantities per item per location; Warehouse Wizard keeps pallet-level traceability on the floor. No NetSuite change
B. Pallet number stored as a lot number	Only viable for items that are, or become, lot-tracked. As you pointed out, a lot-tracked item is a different NetSuite record type, so converting existing items means recreating them. Consider only for items that genuinely need expiry tracking
C. Custom pallet record in NetSuite	Informational only; it would not change NetSuite's stock figures. Jan is testing whether it is feasible

Reorder points

Purchase ordering from reorder points stays in NetSuite, which already supports it at location level. Warehouse Wizard adds what NetSuite cannot do: replenishment from bulk storage to a picking bin when that bin runs low (Phase 3).

Outbound and returns

Units of measure

Your bale-and-bag example changes the scope. Warehouse Wizard today knows how many units are in a package, but not NetSuite's full unit hierarchy, and it picks whole pallets only. For sales order picking it must carry NetSuite's units for each item and

convert between them. When an order does not make up whole cases, it must switch to the smaller unit and show the operator, never round silently. This is one of the largest pieces of Phase 2 and depends on real examples from you.

Two kinds of pick

Pick	From	To	Purpose
Replenishment	Bulk storage, whole pallets	Picking area	Keep picking bins stocked
Sales order	Picking area, by unit of measure	Staging or truck	Fulfil a NetSuite sales order

Partial pallets will be switched back on so a pallet can be picked down from 100 to 0, with the contents of the picking area visible at all times. Picking will be scan-verified; items without a barcode get a label at receipt.

Pick, pack and ship

You said Simplex uses Pick and Ship but not Pack. Warehouse Wizard would create the NetSuite item fulfilment at **Picked** when a pick list completes, then update it to **Shipped** when the truck is loaded. NetSuite reduces on-hand stock and posts to the ledger only at Shipped.

This depends on Advanced Shipping. If it is off, creating an item fulfilment also creates the customer invoice, so outbound work cannot be designed until you confirm the setting.

If NetSuite's own warehouse module is in use at any location, one system must own picking there, or orders will be released to waves and picked twice.

Returns

Customer returns are received against the NetSuite return authorisation, which creates an item receipt as you described. Each line is either restocked or written off. If the Inventory Status feature is on, returned stock can instead go into a quarantine or damaged status for inspection. **This needs Advanced Receiving.** Without it, NetSuite combines the receipt with the refund and Warehouse Wizard cannot post the receipt separately. Returns are Phase 3.

When a fulfilment cannot be completed, Warehouse Wizard will send the remaining items back to receiving, build a new pallet and put it away again.

Your questions and tasks

The first two decide whether outbound and returns can be designed, and should be answered first.

#	Question	Why it matters
W1	Is Advanced Receiving switched on?	Sets the PO statuses, and whether returns can be received separately from the refund
W2	Is Advanced Shipping switched on?	If off, every fulfilment Warehouse Wizard creates also invoices the customer
W3	Can you confirm Simplex uses Pick and Ship but not Pack?	Sets how many status updates Warehouse Wizard sends
W4	Are Advanced Bin Management and Inventory Status switched on?	Sets whether bin and status detail can be sent on each line
W5	Which items are lot or serial tracked today, and how many would need converting for expiry tracking?	Sizes the cost of the pallet-as-lot option
W6	Can you send real multi-level unit-of-measure examples — the rice bale and bag, plus two or three others?	Units of measure is the largest Phase 2 estimate
W7	Is Allow Overage on Item Receipts switched on?	Sets whether more than ordered can be received
W8	Which short-delivery policy should apply: receive what arrived, receive and flag, or receive and adjust?	Shapes the receiving screens
W9	For returns, who decides restock or write-off — the warehouse or finance?	Sets whether the choice appears on the warehouse screen
W10	Do transfers between the three warehouses use in-transit ownership, and is Use Item Cost as Transfer Cost set?	Changes how transfer receipts are matched
W11	Should automatic PO generation from reorder points stay in NetSuite?	Recommended: yes
W12	Is NetSuite's warehouse module licensed and in use at any location?	If so, one system must own picking there

Tasks

- ☐ Define zones and bins for Pine and Lower Estate, with Roget
- ☐ Create the matching bins in NetSuite, with Jan
- ☐ Identify the items that need expiry and lot tracking, with Roget
- ☐ Take part in acceptance testing on the beta sandbox: a real container, a short delivery and a transfer

The full proposal, including cost and delivery plan, accompanies this brief.
