Warehouse Wizard × NetSuite — NetSuite Developer Brief

Update · 21 October 2026 · Russell Hunte

Jan, thank you for the receiving service and the sandbox setup. This update lists what we have received from you and what is still open. The record-level detail in the brief of 24 September is unchanged.

Received

Item	Notes
Inbound shipment receiving service	Script `customscript_spx_ww_inb_receipt_rl`, deployment `customdeploy_spx_ww_inb_receipt_rl`, released in the sandbox. Idempotency on custom body field `custbody_spx_ww_external_ref`; a retry returns `alreadyProcessed: true`.
Sandbox integration and certificate	Account `9738806-sb1`. Test connection passes. The integration record has the RESTlets scope as well as REST Web Services.
Adjustment GL account (sandbox)	In use. Adjustments posted from Warehouse Wizard on 10 October.
Sandbox test data	IS052 (internal id 52) carrying PO76 and PO233; lot-tracked item TC5226Y; LOC-01 Lower Estate with bins; TO05; SO1948; RMA07.
Line identifiers	Your understanding is recorded: source orders use `line`, and receipt lines from `!transform/itemReceipt` use `orderLine`. We are confirming this against the sandbox now.

Coordination

- Our token request now includes the `restlets` scope, so Warehouse Wizard can call the receiving service.
- We will tell you before posting any receipt against IS052, so we do not both consume it. Please do the same.
- The sandbox runs as Administrator (`-3`) with the deployment open to all internal roles. That is fine for testing; the production list below replaces it.

Still open in the sandbox

#	Question or task	Why it matters
J6	If a PO on an inbound shipment is received directly, does the shipment's received quantity update, or does NetSuite refuse? You are testing this on a separate PO.	Confirms whether inbound shipments have a fallback
—	Can the REST transform for a transfer order receipt name which fulfilment is being received? If not, those receipts need the RESTlet approach too, using `record.transform` with the fulfilment in `defaultValues`.	Transfer order receipts

#	Question or task	Why it matters
—	The integration role cannot read `bin` or `wave` records. Is that a role permission or a feature that is off?	Bin mapping, and coexistence with NetSuite's warehouse module
S3	Run the read-only discovery queries from the 24 September brief and share the results.	Answers several open questions without screen checks
J4	The account's concurrency limit, and how much of it is already in use.	How many requests we may run in parallel
J7	When can the PO number be added to the printed receiving report?	The receiving flow starts from that sheet
J8	What did the pallet test find?	Recorded against the pallet decision
J9	If NetSuite's warehouse module is active at a location, can a fulfilment be created there without a wave?	Whether both systems can run side by side
S5	Create the mirrored bins for Pine and Lower Estate, with Wilson.	Bin mapping

Before production

1. Create a dedicated integration role with only the permissions listed in the 24 September brief, limit the receiving service's deployment to it, and send us the role name and id.
2. Upload the production M2M certificate and confirm Test connection passes. The certificate downloads from Settings → Integrations → Signing certificate.
3. Tick the RESTlets scope on the production integration record, as well as REST Web Services.
4. Deploy the receiving service to production (host `9738806.restlets.api.netsuite.com`) and give the integration role permission to run it.
5. Send the production general ledger account for stock adjustments, and the subsidiary if needed.

The updated Integration Proposal of 21 October 2026 lists everything still open across the project.
